

Sven the Cactus presents...

Word Adventures

The word of the week is:

A plant whose stem requires support, and typically grows climbing by tendrils, twining, or creeping along the ground.

Vines are very adaptive to their environment and are a type of plant that uses the least amount of energy to grow by using near structures to help.

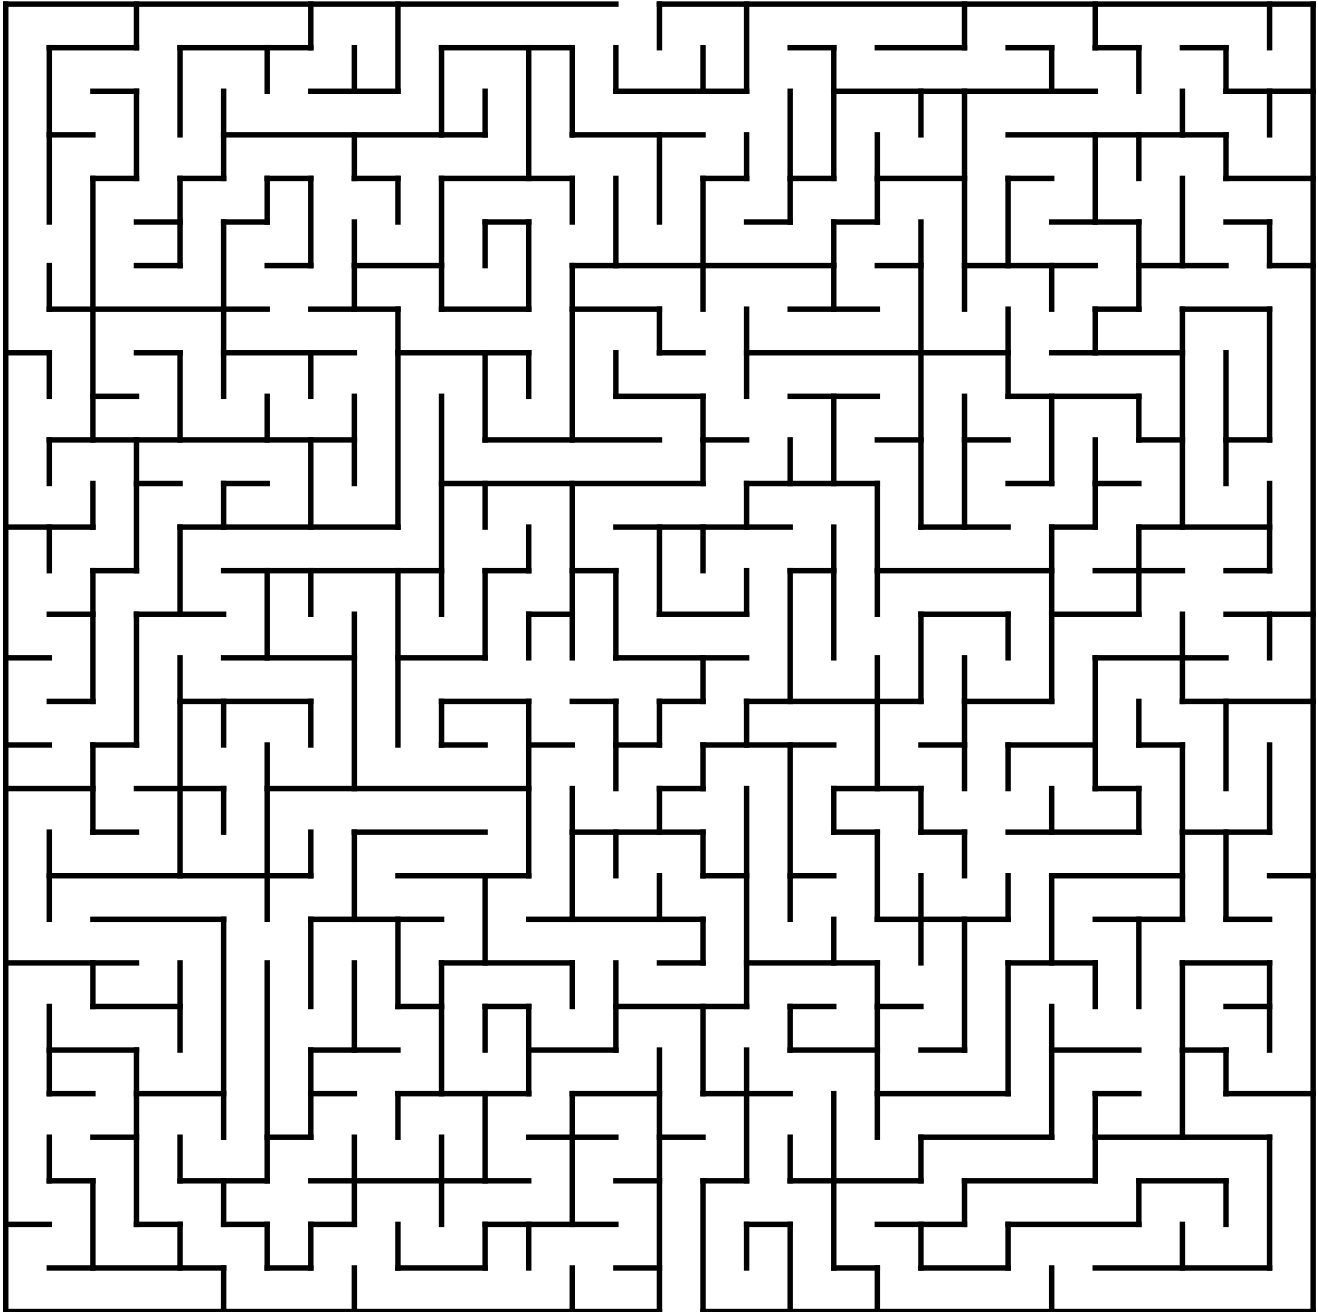

Vines have tendrils that look like springs or coils, it's these parts of the plant that help anchor it and protect it from the wind.

Word Adventures: Vine

Activity of the week: Maze
